Website setup 1

Websites are powerful tools to show your work to the world! Not only that, can be a great way to document and organize your projects in a visual way - exactly what I am trying to do right now

This Page will have multiple sections on how to customize your website, from the basic to the fancy stuff. I hope to include enough content to create a nice website for yourself let's do it!

Warning

Remember that Quarto has a great [website](#) with **A LOT** of information on websites.

Website setup

First things first, we need to learn how to setup the basic structure of our website. This include first order things like [themes](#), titles, format, navigation bar and others.

To start, create a website Quarto Project to generate the base files. I am using VS Code and this is what I need to do:

After creating a project folder, you can find a file called `_quarto.yaml`. This is the key file to setup your website settings. For example, if you want to edit the website title you can find some like the following

```
---
project:
  type: website
  output-dir: ../../docs

website:
  title: "Learning Quarto"
```

```
navbar:
  left:
    - href: index.qmd
      text: Home
    - href: websites.qmd
      text: Websites
    - href: dashboard.qmd
      text: Dashboards
    - text: Examples
      menu:
        - href: authoring.qmd
          text: Example 1
        - href: computational.qmd
          text: Example 2
        - href: walkthrough.qmd
          text: Example 3
```
